

Spend 15 minutes doing general research on each issue to do this. Take each topic and enter it into the catalogue and database search tools at your library. Or if you've got no time for a library, then check out the chapter about the best search engines that are built specifically for researchers. There's plenty of information on those.

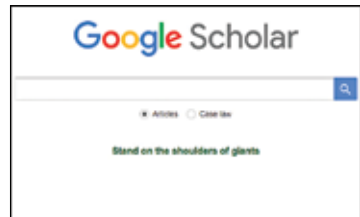

The library, a great place to start researching

The specifics of this procedure will differ from one library to the next. Consultation with a librarian can be extremely beneficial in this situation. They can teach you how to utilise the tools at your disposal, as well as introduce you to others you may not be aware of.

Also, if you have an expert or mentor that you can reach out to for more information or to help you fine-tune your search efforts, then now would be the best time.

Type in your topic once you've figured out where to look. We recommend combining multiple search engines or tools from your local library such as the library catalogue, a science database search engine, and a Google Scholar search.

So, what exactly are you looking for? Essentially, you're looking for a

For research papers and other scientific publications
