

Cognitive biases and how to avoid them

Subconscious errors can alter the way you perceive information so here's how you can avoid them

Cognitive bias is something that everyone has. It may be simpler to detect in others, but it is crucial to recognise that it has an impact on your own thinking. Things like just paying attention to news that confirms your beliefs, blaming outside factors when things go wrong, and assuming that everyone shares your opinion are all symptoms that you may be impacted by cognitive bias.

You want to assume that when you make judgements and decisions about the world around you, you are objective, logical, and capable of taking in and assessing all of the information accessible to you. Unfortunately, these biases might cause us to make poor decisions and poor judgements.
