

other car, which you would attribute to being late (an external attribution to a negative event) rather than being a horrible person.

Hindsight Bias

The tendency to interpret past events as more predictable than they actually were is known as hindsight bias. Why do we place such a high value

BEFORE EXAM

I feel I should study these topics. These might be asked in exam.

AFTER EXAM

I knew that question will come in the exam, I should have studied it

Hindsight is always 20:20

on understanding the outcome of an event only after it has occurred? There are cognitive and motivational reasons for this.

When sports spectators know the outcome of a game, they frequently question or second-guess judgments made by coaches that they would not have questioned or second-guessed otherwise.

Fans are also eager to say that they knew their team would win or lose, but they only say this after their team has won or lost.

Although research studies have shown that simply acknowledging the bias may not always minimise the bias, it does help.

You can nevertheless make an effort to remind yourself that you can't anticipate the future and encourage yourself to think of other possibilities.

It's critical that we do everything we can to decrease this bias because when we're overconfident in our ability to foresee outcomes, we're more likely to make future risky actions with possibly dangerous consequences.
