

Every student who has written a research paper is aware of the numerous limits that apply to the sources employed. They must be written by trained and credible experts or organisations, and they must strictly follow the quality, transparency, language, organisation, and presentation requirements that are anticipated of the relevant type of information, whether it is a publication or a database. Scholarly sources are generated by adhering to these high standards, thus they are more likely to represent the truth. Authors ensure that they deal with truth rather than fakes, myths, delusions, and poor research by employing excellent sources in their research papers.

Almost every internet search currently begins with the most universal instrument - an online search engine - and this is true for most types of information, including academic research. A good search engine must provide relevant results to its users, have a simple design and user-friendly interface, and provide tools to expand or narrow a search. For many people, Google has become the most used web search tool throughout time.

However, there is no such thing as a universal search engine that can find anything. For advanced and more detailed Internet searches, it's a good idea to use various search engines. To filter out irrelevant sites and advertising and get exactly what you're looking for, you'll need to consider how to phrase your inquiry correctly and then spend time examining the results.

Both generic and specialised search engines exist. The general engines listed above are well-known, whereas specialist engines assist in finding material on a specific topic. Depending on your needs, you should pick one or more of these.

To assist students in their quest for actual knowledge, we've compiled a list of specialist databases and search engines that could be useful in researching information for a research paper.

Google Scholar

Despite the fact that it is similar to the most popular generic search engine, this tool focuses solely on searching through academic articles and publications. Even academics utilise it on a regular basis because of several essential benefits such as universality and automation, which means that new material is not added manually, as in a human curated database, but rather is acquired automatically from all over the internet using algorithms.
