

REUTERS

Reuters, a trusted news organisation

Someone might even try to imitate a credible news organization's URL, so double-check that it's not misspelt or missing a few letters.

Do they cite their sources for their data?

A trustworthy source always mentions their external sources of information to back up their factual claims, whether we're talking about news pieces or scientific papers. Unless the source has requested anonymity, news organisations compel journalists to identify their sources. Experts like to take credit because they know that quoting other experts strengthens their arguments. Examine journalistic, intellectual, and scientific sources with caution. Even official-sounding sources may be biased or not as trustworthy as they look.

Is it possible to get the same information from other reputable news sources?

Is the website you're reading the only one with this information, or are there other well-known, reputable news outlets that have reported on it as well? It's probably bogus news if one website is the only location where you can discover any information on a topic. Even the most current breaking news reports were immediately disseminated across multiple news channels. Check the veracity and authority level of any other sites that are publishing the information.

Is the author genuine and trustworthy?

Take time to figure out who wrote a piece of content. If the author's name and credentials are revealed on the website, it's a positive sign that they're ready to stand by their work and risk their reputation.

However, a single author isn't enough to suggest a trustworthy source. It could be a fictitious character or a pseudonym, or they could be unqualified to write about the subject. Check to see whether the author gives any links
