

Organising data

Information without structure is not of much use. Here's how you can organise your data.

Once you begin creating, collecting, or modifying data and files, they can easily become disorganised. To save time and avoid future problems, you and your colleagues should agree on the file and folder names and structure. By incorporating documentation (or metadata) you may provide context for your data, allowing you and others to comprehend it over the short, medium, and long term.
