

We cover everything, from figuring out what to research, to thinking about the right questions and approach methodologies, to gathering data from every source imaginable, to properly categorising and organising the data that you have gathered to finally putting them all together to produce an article of genuine research. Along the way, you could fall prey to one of the many logical biases that are known to plague people. We'll take you through the common ones and help you avoid them during your research. Master each and every skill in this process and no one will ever dare call you a graduate of WhatsApp University.

We hope that this FastTrack is genuinely helpful to everyone that reads it. If you have any feedback or suggestions for future topics, please write to us on editor@digit.in and we'll do our best to accommodate them. Happy reading.
