

MindNode

The majority of mind mapping applications are web-based, and when a native application is offered, it is merely a shell for the web application. It's fantastic if you want the collaboration, sharing, and other capabilities that an online service provides, but what if you simply want a simple way to brainstorm independently?

MindNode, which is available as a native Mac, iPhone, and iPad application, is ideal for Apple users. Create a new map on one device and it syncs instantly via iCloud to all of your other devices. The app is exactly as simple to use (and just as effective) whether you like to press the + icon

on your iPhone or click it on your Mac to add a new node. And, because it's a totally native application, there's no need for an internet connection? There is no issue.

Additionally, MindNode has an Apple Watch app, Apple Pencil support, and interaction with popular to-do apps such as Apple Reminders, Things, and OmniFocus. To convert any node into a to-do item, select it and click Add Task. Alternatively, select Export to Things (or OmniFocus) from the share menu, and your mind map will be converted into a project in your preferred software, complete with all your to-dos ready to be checked off. It's an excellent method for transforming a brainstorming session into something concrete.
