

screen time and the per-app usage, and even allows you to set daily screen time targets to be met, so it doubles as a productivity tool app itself (and yes, we tested the app to see it categorise itself under the Tools section).

DOTS

Quick note: a decent chunk of this app is locked behind a small paywall. Don't want anything minimalist? Looking to blow your eyes out every single time you snap back to your home screen? DOTS has you covered.

This absolutely explosive (and we don't mean that metaphorically) interactive wallpaper makes it so that every touch will create a blast on the particles showcasing a shape or word, destroying it all. And leaving it alone for a while will regenerate it. The particle effects are strong with this one and it could lead to shorter battery life if left on the home screen too often.

Rotating the phone around will even give it tilt, and showcase the wallpaper's depth perspective capabilities. Dragging your finger around the home screen will also rotate the wallpaper.

The app itself has quite a few options to tweak around, the main one being the word or design that the particles create when in rest. You can choose between a word, a letter, a shape or some special custom options as well! One thing we found was surprisingly lacking was the option to use your own word rather than the list of provided words, but it's a small nitpick.

There is the option to scale the size of the dots based on your screen size, but the default option worked for us pretty well. Another option that the app provides is the ability to randomly change the design type and category. You can even decide on the timer based on which it will shuffle into a new design. There are graphic quality settings, and the option to reduce the framerate, which are obviously there for users who simply want to save on their bat-
