

KWGT app does not offer any widgets at all! Instead, it serves as a platform for other developers to make and sell their widgets. By crowdsourcing the entire category, the KWGT widget community has grown into one of the largest widget communities there is and out of that community comes a lot of cool, jaw-droppingly beautiful and customisable widgets that are sure to make anyone ask “Hey, where’d you get that!?”

Basic setup

We’re starting with a blank home screen with no widgets on it.

We’ll guide you through each of the steps involved in setting up KWGT and installing a custom widget. First off, open the Google Play Store and search for KWGT. You’ll see two options there. “KWGT Kustom Widget Maker” and “KWGT Kustom Widget Pro Key”. We’d highly recommend that you buy the pro key with the free version of the app. You see, in order to unlock the full potential of this app, you will need to buy the pro version. This chapter will be based on the pro version of the app. Once you’ll see what this app can do, you too will be tempted to spend ₹99 bucks on this bad boy.

Adding your first widget

After you’re done installing the app, DO NOT open the app. Yes, you read that right. Don’t open the app once you have installed it. The reason behind doing that is that even if you do decide to open it, you’ll be greeted with a “basic setup guide” and the app will close itself. You see, you cannot add a widget from inside the app. You’ll need to add a “blank” widget first to your home screen and then you can get started on customising it.

Firstly, clear any widgets you have on your home screen to make it a blank slate - just like ours. Then, go to your home screen. Long press anywhere and bring up the “Widgets” menu. From there, scroll down till you see “Kustom Widget” listed.
