

click on the first option - “AIO Settings”. Here’s where the magic happens. Skipping everything, if we scroll downwards, you’ll see a huge list of checkboxes. This list is basically all the widgets that you can add to your home screen. You can individually turn them off or on and some supported widgets even let you change their internal settings too.

Of course, we will not be diving into each and every setting listed here. If everything that we mentioned above didn’t get you hooked to the launcher already, we don’t know what will. Anyways, by far, the coolest feature that we found in this launcher is the support for Lua scripts. If you know a bit of Lua and want to dedicate some time to it, you can create your own custom Lua script and add it to the Launcher as a widget. Head over to the “Scripts” menu in the settings. The Launcher comes pre-configured with some scripts and it is up to you to download/make more.

Lawnchair 2

Lawnchair is one of the oldest players in the game and honestly, it’s still a very... very good option for anyone who is in the market for a simple, pixel-experience like launcher which is also easy on your device’s resources.

Install the app from the Google Play Store and set it as your Default Home App. Once you’re done with that, go to your home screen and you’ll find a familiar UI waiting for you.

If you use the app for a while, you’ll find that there is nothing interesting about it. No special features, no over-the-top customisability. Just simple, plain stock Android-ish UI. and this is exactly what the developer was aiming for. You see, this Launcher is especially useful for people with MI, Oppo or Vivo phones. The stock launchers on these devices are very cluttered and a bit hard to use. Whereas Lawnchair just gets straight to the point. Home screen, app
