

provides its own solutions. It is split into three screens, namely, 'Tiles', 'Root' and 'Tree'.

'Tiles' is the home screen where the user can arrange their apps in neat drawers based on their categories and usage. Ratio also provides a way to automatically sort the apps into neat drawers for the user. Swiping up all the way reveals the entire app drawer with all the apps in it.

Swiping to the right of the home screen opens the 'Root' screen. This has Root's own widgets that include Weather, News, Calendar, Media Player, Spotify Player and a lot more widgets. The user can pin some widgets that will be visible on all screens within the launcher which makes information very accessible. The widgets themselves provide enough functionality and display all the information needed in a very neat manner.

Swiping to the left of the home screen opens 'Tree'. This is what sets apart Ratio from other launchers. 'Tree' is a one-stop solution for managing all your conversations across multiple applications on one screen. This feature requires notification access and reads notifications to present all the messages in a neat fashion. It can display and reply to messages from WhatsApp, Instagram, Telegram, Facebook, Signal and SMS. You can even set it to auto-reply at certain times when you don't want to be disturbed.

With the set of tools that Ratio provides, you can actually set up a very non-intrusive and focused ecosystem for yourself.
