

are a predefined amount of shortcuts given to you by your device manufacturer but what if you could add more? What if you want everything essential to you or every essential setting for you at a tap of a button? Well, say no more because “Quick Settings” does the exact same thing. It adds a truckload of shortcuts to your quick settings menu and every shortcut brings something new to the table. Firstly, install the app from the Play Store and as soon as you open it, you’ll see these categories before you:

There are some shortcuts that you can use right away and there are some shortcuts for which root access will be required. As of now, we will stick to the no root shortcuts only. So, let us show you how to set these shortcuts up. From the categories menu, tap on utilities and select whichever one you want. We’ll be selecting the “Internet Speed” one since it’ll give us a handy notification of our current internet speed. Tap on it and tap on “Enable Tile”.

Once you do so, the icon will turn blue. This is how you know if a shortcut is enabled or disabled. After that, swipe down two times to get the FULL quick settings menu like this and press the small “pen” icon on the bottom.

After you do, you’ll see multiple pages of all the quick settings shortcuts available to you. Swipe till you reach the last page and you’ll find the “Internet Speed” shortcut.

Drag that shortcut to where you want it to be. We’re placing it on the last page of our quick settings menu.

Tap on the shortcut to activate it and viola! Your handy internet speed companion pops right up in your notification shade!

That’s pretty much it. We leave the rest to you and your creativity and whatever use cases that you might have. Go on an adventure and discover everything that the app can do. If you find a useful shortcut, pin it to your quick settings and you’ll be ready to go.
