

where we can't guide you because the process of granting those permissions is slightly different for every phone. Thankfully, it is very simple and straightforward. Tap on the permission, the app will launch the Settings app, in that, in most cases, the permission to be granted will be highlighted or it'll be simple enough for you to figure it out.

Once you've granted all the required permissions, you should see this screen. Just make sure that the "Running" toggle is on.

After this, don't change anything. Just go to your home screen and pull down the notification shade.

There you go! It was that easy to replace your stock notification shade. Mind you, this new notification shade works exactly like the stock one. All the quick settings are working, you can add or remove quick settings shortcuts and you can long-press those shortcuts to open the Settings app to that setting just like the stock one! Just for comparison, here's our stock notification shade and the new notification shade side by side.

For most people, this should be it. We mean, you got the barebones of a good notification shade. It looks good, it is minimal
