

opening recent apps, muting alarm volumes, and so on. The sheer amount of functionality crammed into this single panel is beyond insane.

So that's a quick summary of this app. We have barely scratched the surface here, and now would be a good time to remind everyone reading that most of these features are locked behind the paid version, but it's definitely worth double or even triple the price tag. We could not recommend Volume Styles more, this is an absolute hidden gem of an app.

VoIEQ

Tired of constantly fiddling around with your equaliser? Don't want to keep changing the volume for terribly mixed songs? VoIEQ has you covered. The simplest and cleanest solution to all volume and equaliser issues, this app is the best plug-and-play solution that we have found.

There are four main options to choose from – Podcast, Noisy, Balanced and Custom. An information section on top describes how each one of these is used based on what's being played. The custom EQ can obviously be tweaked with, and so can the others in the setting menu in the bottom right. There is a calibrate section that tunes the aggressiveness of the auto-equalising based on sound inputs and the user's feedback as well, although this feature didn't seem to make much of a difference from our testing.

The free version of the app will run for 24 hours before locking you out, and you have the option to watch an ad and get access for another 24 hours, or simply go for the paid version. VoIEQ is impressively good at its intelligent equalising, and we highly recommend it for those of you who are frustrated with audio levels being all over the place in whatever you consume

Almighty Volume Keys

One of the biggest drawbacks for a power user when it comes to using phones vs PCs is the lack
