

inconvenient aspect of customising your phone or preparing your phone for customisation. Each app in this list has a different purpose which is why we've put them all together in this chapter. In a way, this might be the most helpful chapter out of all the others in this FastTrack.

Shizuku

Many of the apps on this list require the user to run some ADB commands to unleash the full potential of the application they are using. This is very inconvenient and cumbersome as some users don't have access to their PC at all times. Shizuku is an application to simplify that affair by toggling a button. Shizuku acts as a one-point gateway to grant these permissions to the apps that require it.

However, to grant other apps required permissions, Shizuku requires specific ADB permissions. The app documents everything and guides the user to give it the required permission either by connecting your phone to the PC once or through wireless USB debugging right on your phone. It goes without saying that this app is a must-have for constant tinkerers and power users, simplifying a very monotonous task and saving time.

Cometin

Cometin is a collection of tweaks and modules that you can apply to your phone. On the surface, it seems to function like Magisk or Xposed modules but does not need root privileges. It has a small library of about 13 modules, and the user can only use about five of them simultaneously when using the free version.

Cometin can enhance the functionality of your phone in multiple ways, by adding an Applock, Always on Display, a parallel space for your apps and adds quality-of-life features such as Caffeine (disables standby on demand), Shake actions and even allows you to remap certain buttons. It also includes features like sync notifications and
