

customisations to be made for the layout of the keys, the size of the keyboard, the spacing, the long press duration, and a few more options. One of the best features of the keyboard is automatic integration of several features within a quick access toolbar on the keyboard itself. It's opened by tapping on the arrows on the top left of the keyboard. There are options to search for GIFs, stickers, open your clipboard, quickly translate something and then auto send it while chatting as well, and much more. SwiftKey is definitely one of the reigning kings of keyboards as far as the mobile phone keyboards spectrum goes.

Typewise Keyboard

With keyboard alternatives gearing towards the same theme customisations, Typewise is a little different from the rest with many of its features. It is not focused on heavy UI customisation, but that does not take away from the plethora of features it contains. Firstly, there are two separate installations for the type of Typewise keyboard: online and offline. In the case of the offline keyboard, it values privacy over all other features. As a result, the keyboard runs locally on your device, and no data from your typing is sent to the cloud.

It boasts of a next generation keyboard layout: the honeycomb. Typewise is infamous for its patented layout where all the keys are arranged next to each other in a hexagonal manner. Thanks to this, keys are 70 percent larger and easier to hit. While it presents quite the learning curve, once you are able to overcome it there is no turning back! Typewise guarantees 33 percent faster typing with its layout. But don't worry, if you are not able to adjust to this new keyboard, you can always switch back to the standard QWERTY. Typewise works on intuitive gesturing to
