

implement basic keyboard features like deleting. You can swipe up to capitalise a letter, swipe left to delete or swipe right to restore your sentence just like ctrl+Z.

Since it executes functions completely differently compared to a basic physical keyboard or even the standard Gboard, most users complain of its learning curve. But if you are someone who values efficiency and privacy and uses the mobile keyboard for long hours in the day, Typewise's enhancements are worth learning. Some more features of Typewise such as automated language switching and customised gesture typing are locked behind a paywall under Typewise Pro. If you want to invest in a keyboard with high and unique functionality, Typewise is the one. Typewise also has very responsive support on Playstore reviews, so you can interact with the support team and request new features as you want.

AnySoftKeyboard

If you are looking to customise your own themes the open-source way, AnySoftKeyboard is the one for you. While their own themes are beautiful to implement, all their code is available on GitHub and open to modifications. It has all three types of theming: the standard dark, system-based and manual. In system-based mode, the keyboard picks up the colour of the app you are on; green for WhatsApp, orange for Reddit and so on. For people big on privacy, AnySoftKeyboard comes with an incognito mode, so you do not need to worry about your private information being stored in a random server.

Feature wise, it has four main components to focus on: being lightweight, fast, accurate and private. Its accuracy
