

is tested via its support of multiple languages through various packages. Automatic correction can be adjusted or completely disabled. Word lists from external packages can be freely mixed. For example, you can use a French layout and get prompts for words in German and Russian. AnySoftKeyboard contains the standard, uncompromisable swipe typing and a dedicated keyboard for text fields that only require numbers, dates, emails, or URI addresses. It also has multi-touch support; you can shift+key in your phone to access various letters etc. The keyboard can be compact on your screen to consume less space. Additionally, it also supports physical keyboards.

Floris Board

As more and more consumers are growing concerned about their data and privacy, they are slowly shifting from applications owned and developed by corporations to open source projects in order to be completely sure of their privacy. Floris Board is one such project hosted on Github which promises all its users' privacy.

FlorisBoard has most features available on mainstream keyboard apps like one handed mode, gesture typing, number row, clipboard. It also includes customisable themes with presets and even allows users to create their own themes.

It also includes nifty shortcuts on the top bar of the keyboard like undo, redo, clipboard, cut, copy paste etc. However, one of the downsides of using FlorisBoard is its lack of support for regional languages. But with an active developer team, that is bound to change in the future.

GCAM

Okay, let's get real here. Your stock camera doesn't really cut it. Wait, you're saying that it does? Sure, it takes "Good Enough" photos but have you ever wondered what is the FULL potential of your camera lens? We'll give you one more thing to ponder upon. You see, the Google Pixel series – Google's inhouse
