

phones didn't change the camera for 4 consecutive generations of their phones. Yes, that's right. The Pixel 4 had the same camera lens as the Pixel 1. Just for context, the Pixel 1 was released in 2016 and the Pixel 4 was released in 2019!

But wait, if they kept the same sensor for four years, how did they achieve such good picture clarity? How did they manage to top the camera game and compete with the likes of iPhone and Samsung for four years? Well, the answer lies in the software. You see, while the world was stuffing megapixels into their cameras and not really focusing on the software, Google took the inverse approach. They didn't stuff megapixels into their camera. They kept it at 12 MP but worked on the software. This resulted in the "relatively" inferior sensor taking much better pictures and videos just because of Google's all hard work and development in their camera software called the "Google Camera". Now, we won't go into detail and explain how the Google Camera works on the backend but yeah, we can help you to bring the true Google Pixel Camera experience to your phone.

Some smart people on the internet wondered that if this app works on the Pixel devices then maybe, just maybe we can get it to work on other devices and hence, the GCam was born. GCam is a very device specific app which brings almost all the Google Camera features into your non-Pixel device. Trust us, once you see the difference between your stock camera app and the GCam app, you'd really want to curse your device manufacturer for not optimising the stock camera app.

The pre-requisites

Now that the history is out of the way, let's talk about the pre-requisites. There really are only 2 pre-requisites to having GCam on your phone. Firstly, your phone should be modern. We know that "modern" is a very vague term but just know that if your phone is from a reputable model from a reputable brand and is released in the past 2-3 years, GCam is sure to work on your phone. The last prerequisite is the support
