

model supported. If you scroll down, you'll find a big table listing the appropriate forum for your phone model and it's all sorted Brand wise.

Now, just scroll down till you find your phone from the list. We're testing this on a OnePlus 9 and hence, we'll scroll down till we find that.

|     |                                                   |                          |                            |

Now, just click on the “Click Here” and you'll be redirected to a forum where GCam for your specific phone model is being discussed. Now, here's where our paths diverge. It's up to you to read the forum and follow the instructions correctly to download the correct version for your specific model since instructions for almost all the models are different. Fortunately for us, since we're using a very mainstream device, we didn't even have to scroll down in the forum. We found the link on the second post itself and downloaded the apk for it.

### Installing the APK

If you've never installed an APK before, you should read this part of the chapter. If you have experience of installing APKs then the chapter ends here for you. Just install it and start using it. Or in XDA's words “Choose the correct APK for your device, change into the right settings, and shoot away to some stunning photos with the Google magic!”

Now, for the people who haven't installed an APK, firstly if you were doing the above process on your PC, transfer the file on your phone. If you were doing it on the phone itself, you'll find the APK listed in your Downloads folder.
