

Forest Live

A simple minimalist wallpaper app, Forest Live generates a clean looking scenery based on the parameters you provide.

Simply open the app and give the basic permissions, and you will be greeted with a host of options to tweak around. The first is a colour setting to choose the exact hex (hexadecimal) colour of trees, hills, mountains and even the shade of the sky. You can also select the time of the day, or synchronise it with the current time of the day.

You also get to select options for which layers are rendered, such as stars, clouds, and mountains. Moreover, there are multisampling and 3D parallax effects to toggle on and off, although they come at the cost of higher RAM and battery consumption.

Finally, you can choose to set theme packs and use a seed value to randomly select the parameter values. Once you are done with twisting and turning the knobs, hit “Use this Wallpaper”, and you are good to go!

You can choose between setting it as your lock screen wallpaper or your home screen wallpaper too. The cherry on the cake for this particular app that distinguishes it from the rest is the option to render the visuals at 200 FPS, so you can finally make use of that high refresh screen at all times, not just while scrolling mindlessly through Instagram! Do keep in mind that rendering at such a high frame-rate at all times will consume more battery.
