

Backup and Restore the registry

You never know when you'll need it

Modifying the Registry in Windows 10 is never a good idea because the database contains low-level settings required for the system and specific programmes to function properly, and even the tiniest error can prevent the device from booting.

You can still recover Windows 10 using a secret Registry backup if you recently changed system settings or installed a defective update that caused the computer to stop working. There is one exception, however: because the operating system no longer creates these backups automatically, you must manually re-enable it before using it.
