

How to create and edit Registry files

Make customisations to the registry with your own entries

The .reg file extension refers to a Registration file that is utilised by the Windows Registry. Hives, keys, and values can all be found in these files. These files can be created from scratch in a text editor or by the Windows Registry when it backs up parts of it.

Getting started

There are two major ways to edit the Windows registry:

- Open Registry Editor and then make registry changes manually.
