

registry entries and values that already exist. Whether you want to add, delete, or edit one or more keys or values in the file, merging/importing is the only method to do it.

Before merging your custom-made or downloadable .REG file with the Windows Registry, make a backup. If you're restoring a prior backup using this file, you can skip this step, but in all other circumstances, don't forget to do so.

Simply double-click the file to merge/import it with the Windows Registry. This procedure is the same regardless of the contents—a previously created backup, a registry change you created, a downloaded “fix” for a problem, and so on.

You may receive a User Account Control notification that you must approve in order to import the file, depending on how your computer is configured.

If you're confident that the file you've selected is safe to add to the registry, select Yes on the next prompt to indicate that you wish to do so. You may need to restart your computer depending on the modifications the REG file made to the Windows Registry.
