Changing Folder icons

Do you want to replace all of your computer's normal folder icons in one go? To do so, you'll have to look through the Registry. Remember that doing so has the potential to harm your system, so proceed with caution if you choose to do so.

To get started, go to the Start menu and type `regedit`. To proceed, you'll need to grant administrator permissions. To get there, go to the following address:

```

HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\Current-
Version\Explorer

```

Select `New > Key` from the context menu of the Explorer folder in the left navigation tree. Select the new key `Shell Icons` in the left panel and give it a name. Right-click in the blank spot on the right and select `New > Expandable String Value`. Give it the number three. Create a new string called `'4'` by repeating the previous steps.

Double-click the three strings you just created. Put the location of your folder icon in quotes in the Value data box. Holding `Shift` while right-clicking your ICO file and selecting `Copy as path` is an easy way to do this.

This is what it should look like:

```
"C:\Users\User\Documents\ICO Icons\folder.ico"
```

Rep for the string `'4'`, then click `OK` to close the Registry Editor.

If your changes don't appear to be taking effect when you open a new File Explorer window, you'll need to restart File Explorer. To do so, launch the Task Manager by pressing `Ctrl + Shift + Esc`. If necessary, click `More details` to expand it. Locate `Windows Explorer` on the `Processes` tab. Choose `Restart` from the context menu when you right-click this.

This should update all folders with your new icon. Simply delete the `Shell Icons` Registry key you generated to get rid of it in the future. This solution works in Windows 10 version 20H2, however, it may not work in other versions. As a result, your mileage may vary depending on your Windows 10 version. **d**
