

If no value is specified, Windows waits 128 seconds for the transaction to complete. If you're in the middle of anything and your connection with a server suddenly goes bad, your computer will lag horribly.

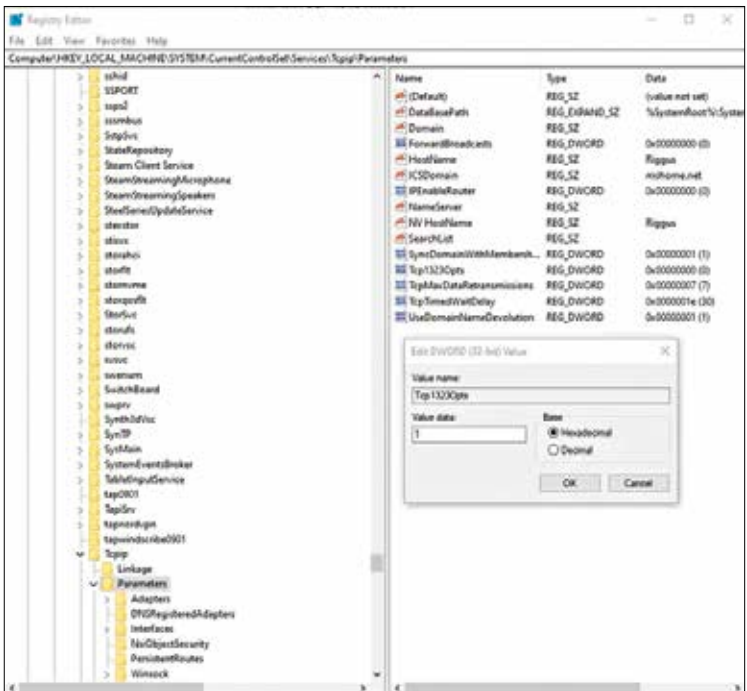

Here's the location of the key in your registry:

`\HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters`

Within the "Parameters" key, create a DWORD value called "DefaultTTL." Any number between 1 and 255 can be used as the value. The optimal value is 64, although you can select lower values if you want the packet to be terminated faster.

Tcp1323Opts

Tcp1323Opts provides three ways to implement RFC 1323, often known as "TCP Extensions for High Performance." This value is compatible with network window scaling and timestamping. This allows a TCP connection

Tcp1323Opts
