

Adding Command Prompt to Context Menu

It can be inconvenient to constantly type commands into the command prompt. It would be much simpler if you could, for example, right-click at a spot to open the command prompt pointing directly to that location. You certainly can!

In the registry editor, navigate to:

`HKEY_CLASSES_ROOT\Directory\shell\cmd`

Because the “cmd” registry key is protected by default, you’ll need to acquire ownership of it at this point. Take control of protected registry keys by following our instructions.

After that, right-click the “HideBasedOnVelocityId” entry in the cmd folder’s right-hand pane, select “Rename,” and add a “_” to the beginning of the name so it doesn’t register.

That’s all there is to it. Close the registry editor, and the right-click context menu should now include the option to “Open command window here.”

Revert to Windows 10-style Start Menu

The new-look Start menu is one of Windows 11’s most notable features. It’s a lovely appearance, similar to what you’d find in Ubuntu or macOS, but for others, the shift is too severe, and you’ll want to revert to the old-style Start menu.

Well, with this Windows 11 registry hack you can. Navigate to:

`HKEY_CURRENT_USER\Software\Microsoft\Windows\Current-Version\Explorer\Advanced\`

Create a new DWORD 32-bit Value by right-clicking an empty space in the right-hand pane and naming it “Start ShowClassicMode.”

To enable the Windows 10-style Start menu, double-click it and update the “Value data” to “1” after it’s been created.

Use Windows Photo Viewer Instead of Photos App

Everyone has had issues with the Photos app in Windows 10 at some point. It isn’t a big secret. Simultaneously, the Windows Photo Viewer, which we remember from Windows 7, did an excellent job, but it was eliminated with a Windows 10 upgrade a few years ago.

In Windows 10, the code for Photo Viewer is still present. To unlock it, you simply need to make a very complex registry entry. It’s not your normal registry tinkering.
