```

After that, go to “File -> Save as” and save the file as a “.reg” file. After saving, open Windows Explorer and navigate to the new reg file, right-click it, and then click “Merge.” The file should be successfully registered. When you right-click an image file and choose “Open with” and “Choose another app,” Windows Photo Viewer will appear as an option once more (perhaps after choosing “More apps”). Select it, then check the box that says “Always use this app to open files.”

Disable Windows 10 Lockscreen

The lock screen adds an extra degree of security to your Windows PC by forcing you to log in with a password or PIN. You can disable the lock screen entirely if you are confident in the security of your computer.

You can utilise the procedures below if you don’t have access to the Group Policy Editor but do have access to the Registry Editor.

By going to the Start Menu and searching for and clicking on “Run,” you may access the Run application. To access the Registry Editor for your system, put regedit into the search box and click “OK.”

When the Registry Editor appears, click on the folders in the left panel to navigate to the following route.

```
HKEY_LOCAL_MACHINE\SOFTWARE\Policies\Microsoft\Windows
```

Once you’ve arrived at that location, right-click on the “Windows” directory and choose “New” followed by “Key” to make a new key in that directory.

Press Enter after typing “Personalization” (without quotes) as the key’s name.

To create a new DWORD in this directory, right-click on the newly generated key “Personalization” and select “New” followed by “DWORD (32-bit) Value.”

Enter the name of the DWORD as “NoLockScreen” (without quotes) and click Enter.
