

Add Check for Updates Option to Context Menu

To add the “Check for Updates” option to the Desktop context menu, you must alter the Windows Registry, as with many other things. To begin, press “Windows + R,” type `regedit`, then hit the Enter key. Alternatively, you may use the Start menu to look for it.

The preceding command will open the Windows Registry. Copy the path below, paste it in the address bar of the Registry Editor, and hit Enter.

```
HKEY_CLASSES_ROOT\DesktopBackground\Shell
```

You’ll be directed to the key you need to alter as soon as you press the Enter key. We’ll need to make a couple of keys now. Select “New” and then “Key” from the context menu when right-clicking on the “Shell” key.

Press the Enter key to name the new key “Check for Updates.” This is the name that shows in the context menu on the desktop. It is adaptable to your requirements. Right-click the newly formed key and pick “New -> Key” once more. To name the new key, type “command” and then press the Enter key.

We need to point the keys to the update option in the Windows 10 Settings app after we’ve created them. We can do this by utilising a unique URI. To do so, make sure the “Check for Updates” key is selected, then use the right-click context menu in the right panel to pick “New -> String Value.”

Enter “SettingsURI” as the new String Value’s name.

To access the “Edit Value” window, double-click on the newly created value. To save the changes, type `ms-settings:windowsupdate-action` in the “Value Data” area and click the “OK” button.

Now, in the left pane, pick the “command” key, right-click on the right panel, and choose “New -> String Value.” To save the modifications, rename the new String value “DelegateExecute” and hit Enter.

To update the value data, double-click on the newly formed value, type the following value in the blank box, then save the changes by clicking the “OK” button.

```
{556FF0D6-A1EE-49E5-9FA4-90AE116AD744}
```

When you’re through with the aforementioned adjustments, the desktop context menu will have a new option called “Check for Updates.” If you don’t see the new choice, restart your computer. When you choose this option, the Settings app will open immediately and the “Check for Updates” option will be triggered.

This step is absolutely optional, but adding an icon to the desktop context menu listing can make it look a little nicer. To add the icon, press the “Check
