

After you've created the key, select it, right-click on the right pane, and choose "New -> DWORD (32-bit) Value." A new DWORD value will be created as a result of this action.

Press the Enter key to name the new value "AppsUseLightTheme." The value data is set to "0" by default, thus there is no need to change it.

We'll need to construct another one once you've finished creating the new value. In the Windows Registry, find the following key.

`HKEY_CURRENT_USER\SOFTWARE\Microsoft\Windows\Current-Version\Themes\Personalize\`

If you can't find the "Personalize" key, follow the steps above to create one. Right-click on the right pane, pick "New," then "DWORD (32-bit) Value" after you've arrived at the Key.

This action generates a value that is empty. Replace "AppsUseLightTheme" with "AppsUseLightTheme." There is no need to update any value data because the default value data is set to "0" as previously.

Once you've finished producing the keys, simply restart your computer or sign out and back in to view the changes. As you can see, the Dark Mode isn't fully functional (the title bar is messed up). However, once it's finished, you might be able to use native settings to enable or disable it (hopefully).

The Dark Mode currently has irregularities, such as the minimise, maximise, and close buttons not displaying. If you want to go back to the previous state, either modify the value data for both values to "1" or delete the registry values you established before.

Disable Action Center

It's simple to disable the Action Center in Windows 10 using the Windows Registry, and it works for both Pro and Home users. To begin, press "Windows + R," type regedit, then hit the Enter key.

The Windows Registry will be opened as a result of the preceding action. Make your way to the following key:

`HKEY_CURRENT_USER\Software\Policies\Microsoft\Windows\`

We'll need to make a new key once you've arrived. To do so, right-click on the "Windows" key and choose "New" and then "Key" from the dropdown menu.

Rename the key to "Explorer" now. This is how it looks in your Registry editor after it's been renamed.

To create a new DWORD value, right-click on the right pane and pick "New" and then "DWORD 32-bit Value."
