

Fixing Registry Errors

The sooner you get it fixed, the better

The Windows registry is a database that stores critical machine-specific settings and information about practically everything on your computer, including preferences, apps, users, and related devices. The registry is made up of three parts: hives, keys and values. The registry is continually referenced by the Windows operating system; for example, Windows must check the values of particular keys in order to open a programme, install new software, or update your hardware. You can use the built-in Windows Registry Editor (regedit) to alter registry key values manually to make Windows run the way you want it to, but you must know what you're doing or you could gravely harm your OS. And
