

And should you mess things up. We will show you every single method by which you can restore your Windows Registry to the most recent backup that you have taken. Whether you can access Windows properly or not, does not matter. If there's a method to restore the Registry, we have it covered.

We'll then follow it up with how you can make your own editable Registry files. Since the keys and values are universal for a particular Windows version, you can create files which allow you to make single or multiple registry entries. These can then be shared with your friends so that they too can enable/disable certain Windows Features.

And lastly, we'll take you through the different methods of fixing commonly seen Registry issues and even help you with some of the most popular Registry Cleaning software that you can use as part of your regular PC maintenance process.

We hope that this FastTrack takes away the fear that people generally have when they are dealing with the Windows Registry. If you figure out any interesting hacks, please feel free to let us know. We might come out with another FastTrack with more hacks. As always, we're open to feedback, please write in to us via editor@digit.in
