Restore a backup from Safe Mode

This is the most fundamental technique. To begin, start your computer in Safe Mode by pressing the F8 key while it is turned on. When you start Windows in Safe Mode, it launches a minimal environment that helps keep your system stable and protects important files and drivers from corruption. Perform the following commands after you’ve booted into Safe Mode:

To open the Run window, press the Windows key and the R key at the same time.

Enter “regedit” at the command prompt.

To import a registry file, go to File > Import.
