

Browse to the location where you saved your backup file in the Import Registry dialogue box and click Open.

Alternatively, you can browse to the backup location, right-click the file, and select Merge from the context menu. The file will be imported into your registry automatically.

## Restore a backup from Command Prompt

If your Windows machine won't boot into Safe Mode in some cases, you'll have to manually restore your registry from the command prompt. You'll need your original Windows OS disc or an ISO image of your Windows operating system on a bootable flash drive to perform this.

Before Windows starts, press the F8 key and select Repair My Computer. If F8 doesn't work, enter the repair Windows mode by choosing your CD-ROM or flash drive as a primary bootable device in the BIOS. Go to System Recovery and pick the command prompt after starting the Windows OS setup.

We're going to assume your Windows directory is on the C disc. To convert your working directory to the backup directory, use the following commands:
