

```
cd /d C:\windows\System32\config
```

```
xcopy *.* C:\RegBack\
```

```
cd RegBack
```

```
dir
```

Then, using the following commands, replace the current registry settings with the ones from the backup:

```
copy /y software ..
```

```
copy /y system ..
```

```
copy /y sam ..
```

The two periods are included in the command.

Restart your computer once this process is finished.

Restore using System Restore

You can also use a Windows system restore point to restore your computer's registry. When important changes to the system, such as the installation of new drivers, are made, restore points are produced automatically if your computer has System Restore enabled. You can also manually construct restore points.
