

Click the Start menu and type “restore” into the search box to access the System Restore window.

From the list of options, choose System Restore.

Make a choice for a restore point. The most recent restore point will be chosen by Windows. If the registry damage has been present for some time, select Show more restore points to see previous restore points. Each restore point will include a timestamp as well as a brief explanation of why it was made.

To examine all of the programmes and drivers that will be erased from the computer as well as all of the programmes that will likely not work correctly if you proceed with the restore, click Scan for impacted programmes. Any of your personal files will be unaffected by a system restore.

To begin the restoration process, click Next, then Finish. This could take a few moments. After the restore is finished, your computer will reboot.

Restore using Automatic Repair

Starting with Windows XP, newer versions of Microsoft Windows have an automatic repair option. When you run Automatic Repair, it will attempt to repair both corrupt and invalid registry keys. Follow these procedures in Windows 10 (notice that the steps may differ in Windows XP, Windows Vista, and Windows 7):

- Open the Preferences menu.
- Click Update & Security in the Update & Security section.
- Click Restart immediately in the Advanced Startup panel.
- On the Choose an option screen once the computer reboots, click Troubleshoot.
- Click Automated Repair on the Advanced Options screen.
