

CCleaner Registry Cleaner

Probably the most well-known of all the registry cleaning tools in this list, CCleaner, is a well-rounded PC maintenance software. The built-in registry cleaning function in CCleaner can accomplish almost everything a good registry cleaner can do, and it has a nice, clean interface.

Before making any changes, the utility asks if you want to back up the registry. You can also use CCleaner to run a rapid or in-depth inspection of your files, drive, and registry, as well as eliminate any programme leftovers and choose which applications to run when your Windows PC boots up. You may also manage all of your browser plug-ins, discover duplicates, clean your drivers, and much more.

Although there is a commercial version of the available (CCleaner Professional), the freeware version is suitable for most Windows registry cleanup operations. The commercial edition adds automated browser cleaning, real-time monitoring, and technical help, all of which can boost system speed significantly. However, like all registry cleaning software, you could cause more problems than what you have if you delete the wrong entries. After having used the software for years, we can say with certainty that CCleaner has not messed up a Windows installation.
