

system, with the added benefit of being able to interact with it via a RESTful API over *HTTP*.

Amazon’s S3 service is by far the most popular cloud storage option today, and it’s what a lot of startups use to store our video, photo, and audio assets, as well as our CSS and Javascript, user event data, and more.

CDN

The term “Content Delivery Network” refers to a system that allows you to send materials like static HTML, CSS, Javascript, and photos over the internet considerably quicker than you could with a single origin server.

It works by distributing material across a network of “edge” servers throughout the world, causing users to download assets from the “edge” servers rather than the origin server.

A user in Spain, for example, accesses a web page from a site with origin servers in NYC, but the page’s static assets are loaded via a CDN “edge” server in England, avoiding several slow cross-Atlantic HTTP calls.
