

- **OpenResty** – Think of OpenResty as a significant upgrade to nginx and it was even supported by Cloudflare for a significant period of time. It has a market share of about 8% now.
- **Nginx** – Another free open source web server. In recent times, it is getting very popular, with about 31% of all domains worldwide using it.
- **Other web servers** – These include NCSA, IIS, Sun's web platform and LiteSpeed web server.

Webserver attack tools

Some common web server attack tools are:

- **Metasploit**– this is an open-source tool for developing, testing and using exploit code. It runs on both Unix based OS and Windows. It is used by hackers for exposing the vulnerabilities of a target.
- **Neosploit** – Neosploit is a tool used to install, delta and replicate software on the target machine. It's quite dated at the moment.
- **Zeus**– this is an essential tool that is used to turn a compromised computer into a zombie or a bot. A bot is a compromised computer that can further be used to perform internet-based attacks. A botnet is a collection of bots that can collectively create havoc by a denial of service attack or sending spam emails.
