

Open Source Robotics Foundation

Open Source Robotics Foundation (OSRF)

- ROS Lunar Loggerhead, in 2017
- ROS Melodic Morenia, in 2018

Now that we've arrived at this point, it's crucial to note that the final ROS distribution will be announced in 2020. It's named ROS Noetic, and it'll run on Python 3 rather than Python 2 like the prior versions. There will be no more ROS 1 distributions issued after that date, and all development will be focused on ROS 2. (Update: ROS Noetic Ninjemys has been released on May 23rd, 2020.) What exactly is ROS 2? Let's get started...

ROS 2.0

Around 2015, the shortcomings of ROS for commercial products became very apparent. Companies cited a single point of failure (the roscore), a lack of security, and a lack of real-time support as reasons for not adopting ROS in their

products. However, it was evident that if ROS was to become the de facto standard for robotics, it needed to reach out to the industrial sector with a louder voice than the few early adopters who were already shipping ROS-based products. To address this issue, the OSRF put forth the effort to build ROS 2.0.

With the publication of Dashing Diademata in June 2019, ROS 2.0 had already achieved its fourth deployment.
