

What is ROS?

How does the platform work?

Software developers, on the whole, despise working with hardware. It's extremely likely that you're a software developer who has never considered a career in robots. You may believe that programming for robots necessitates knowledge of electronics and possibly mechanics. You probably believe that with robots, the hardware and software are so intertwined that you can't touch one without touching the other. And it's occasionally true...

We had to design a navigation system for a robot about ten years ago. Our navigation programme, on the other hand, was completely broken. We initially suspected a problem with the programme, but after lengthy examination and simulation testing, we discovered that the fault was with the electronics of the laser scanner that we used to locate the robot. To locate the error, we had to go back to the beginning and determine the source of the problem within the physical laser. We have to tinker with the circuits
