

Most modern robot builders offer off-the-shelf ROS APIs, such as the ROS-Components business, which offers ROS APIs for all of its components. If the robot you wish to work with doesn't run ROS, you can still ROSify it to make it operate with ROS. ROSify refers to the process of adapting your robot to function with the ROS operating system. To ROSify a robot, you usually need to know how to access the hardware. You must learn how to interface with the electronics that supply sensor data as well as how to access the robot's motors. We are not covering that topic in this series of ROS tutorials because it is outside the scope of developers. However, if
