

Getting started with ROS

Let's make some robots

In order to create ROS programs, you will need a C++ or Python code editor. In this chapter, we are going to show you a list of integrated environments for programming ROS with those languages. Many others do exist, but we are putting the most complete and easy to start with ones here.

Note: since ROS only works on Linux (at least at present), all the IDEs included here are Linux environments, even if Windows versions may exist.

What follows is a description of two of the best editors for each language. The rest of the information in this chapter has been sourced from wiki.ros.org. We are putting it here for your convenience.

CLOUD IDES

Using the ROS Development Studio as your IDE

You can simplify your life when working with ROS by using the ROS
