

Before opening a package with QtCreator, though, make sure to build the package once with catkin build. If your build artifacts (binaries, libraries, ...) end up in the wrong directory, you built the package first with QtCreator. You can check, whether you have this problem by simply doing a rosrun of your package's node, change code, recompile with QtCreator and do a rosrun again — if you don't see your changes in the executable's behavior, it is probably installed into the wrong directory. To resolve this issue, just clean the package (catkin clean <pkg> for linked layout, for newer catkins, remove the build/<pkg> folder) and rebuild it with catkin build.

With QtCreator of version 4 and higher, you can (and actually have to) configure your compiler etc. in a Kit.

Go to Tools — Options — Build & Run — Kits. In the Default kit (or create a new kit for ROS)

Select the compiler you want to use in catkin

Select CodeBlocks — Unix Makfiles

Change the CMake Configuration to only contain QT_QMAKE_EXE CUTABLE:STRING=%{Qt:qmakeExecutable} (i.e. remove the define for CMAKE_CXX_COMPILER)

In your workspace, execute

```
1 catkin config --cmake-args -DCMAKE_CXX_COMPILER:STRING=/usr/bin/g++ --
```

where you substitute /usr/bin/g++ with the compiler you actually want to use (and which is the same that you selected in the kit above). See this discussion about this issue.

You can configure some default paths in QtCreator:

The default build path (what you normally have to set manually once you open a new project): In Tools — Options — Build & Run — General set the Default build directory to

```
%{Env:CURRENT_CMAKE_BUILD_DIR}/${CurrentProject:Name}
and in your ~/.bashrc (or ~/.zshrc) add a line similar to
export CURRENT_CMAKE_BUILD_DIR="$(catkin locate
--workspace ~/workspace --build)"
```

to define the variable CURRENT_CMAKE_BUILD_DIR.

The path in which to look for projects (i.e. where to start the search when you want to open a new project): Tools — Options — Build & Run — General — Projects directory set Directory to /home//workspace/src (or wherever your workspace is).
