

Let's look at it, starting with one of the most fundamental ideas about AI replacing humans:

Singularity

Singularity occurs when a civilisation evolves to the point that the rules and technologies it produces are incomprehensible to previous generations. Many believe that hyper-rapid technological and scientific transformation will usher in the singularity. Such changes would be so rapid that they would affect every area of society, from human bodies to families to government structures. The point at which all collective artificial intelligence overcomes collective human intellect is another aspect of the singularity theory. After all, if something like this happens, all we know will change for the rest of our lives.

The technological singularity

However, it is difficult to predict what the nature of the changes will be once the singularity is attained. Will AI, with their superior intelligence, conclude that humans have reached the end of their usefulness and are no longer useful? Or would they be ethical and respect our desire to live — after all, we are the ones who gave them life?

Pop culture references

In his 1993 essay “Technological Singularity,” science fiction writer Vernor Vinge popularised the concept of singularity. It’s a moment from where
