

Many people regard the Internet of Things (IoT) and robotics technology as independent topics, leaving the synergies between the two disciplines untapped. However, when the Internet of Things and industrial robots are combined, the result is the Internet of Robotic Things or IoRT.

Dealing with Data Overload

Higher degrees of machine awareness results in an industrial environment that is becoming increasingly rich in sensor-derived data; nevertheless,

traditional computer frameworks are frequently overburdened, negating the benefits of a robotically enhanced workforce in many cases. The practice of pushing data into the cloud for processing is no longer feasible for many applications.

The remedy is just around the corner. Due to the use of artificial intelligence and access to large amounts of data, edge devices, such as robots, are able to make choices considerably more
