

2. Uninstall unnecessary apps

Aside from selling software, Windows makes money by adding new apps to the Start menu with each new installation. That's why, even if you haven't added them yourself, you can see third-party programmes loaded on your machine.

Candy Crush and other games are loaded on Windows 10, but on Windows 11, streaming apps like Spotify and social media apps like Instagram and TikTok have taken their place.

Source: Reddit

Who plays Candy Crush on their PC?

This can be aggravating, especially for novice users who are unaware of the presence of bloatware on their computers. The good news is that they aren't installed by default and don't take up much space on your hard drive. It's also easy to remove them with only a few clicks, making it less of a nuisance. Simply right-click on the undesirable software and select Uninstall from the menu that appears. Then, confirm your selection and go through the process again for each programme.

3. Add (missing) useful apps

There may be some programmes on the Start Menu that you would like to see, but they aren't available by default.

Now is the moment to pin any of those that are missing. You may pin programmes to the Start menu in Windows 11 in the same way you can in Windows 10. Instead of 'live' tiles, the Start menu now features simple icons with descriptions.
