

Double down

your Windows 11 up to date. Navigate to “Settings > Windows Update” to do so. “Check for updates” should be selected.

When new versions of an operating system become available, or when security patches become available, it is strongly advised that users upgrade their operating systems. It’s the most effective approach to get the most out of Windows 11 while also keeping you safe from viruses and other security threats.

11. Set up OneDrive

You’ll get a free 5GB of cloud storage in Microsoft OneDrive when you join in using a Microsoft account. Configuring it can be a little confusing if you’ve never used it before, but don’t worry. You can rapidly become acquainted with it.

When you launch the app, Windows will display a window that looks precisely like your usual File Explorer window, complete with your Desktop, Documents, Downloads, and Pictures folders. This is where things get a little complicated, but these folders are part of the OneDrive programme, and whatever you store in them will be backed up to your OneDrive account. Disable this option if you have backup storage in place.

Open OneDrive from your notification area and go to Help & Settings > Settings > Backup > Manage OneDrive backup to update the settings. This will take you to the OneDrive backup options page.
