

12. Turn on the Windows Sandbox

If you have Windows 11 Pro, Enterprise, or Education, this is a must-have feature. It enables you to quickly create a safe virtual computer without the need for any complicated setup. Because the VM is completely separate from your main system, you can safely visit a dubious website or try out an unknown app. Close the sandbox after you're finished, and it will vanish completely, leaving no record of your experiment.

Although it uses the same virtualization technologies like Hyper-V, it doesn't require you to switch it on and consumes very little system resources.

To get started, go to Search and type Windows Features into the search box to discover the Turn Windows Features On-Or-Off dialogue box. Click the box to the left of the Windows Sandbox feature at the bottom of the list. A Windows Sandbox shortcut will appear on the Start menu after you restart.

It's worth noting that a Windows Sandbox session has nearly no Microsoft programmes. It's completely devoid of frills. You can paste a URL into Microsoft Edge or copy a software file to the sandbox for additional investigation using the Windows Clipboard.
